Use LineEdit::Insert to add lines. For instance:
editctrl.Insert(editctrl.GetLength(), "Some text\nSome More text\n")
Appends two lines to the end of the text.

There are two ways of find functions like these yourself that are much quicker than asking here or even using the manual:
- Typing the name of the class or an instantialion of it followed by :: or . (ie LineEdit::) brings up the autocomplete box with all the member functions for that class and allows filtering as you type.
- Query(Ctrl-Q) allows you to find functions, classes and enums very quickly. For instance, querying 'Blue' takes you straight to all the color definitions. Right clicking on a function gives the option to goto the definition/declaration.
