
Subject: Quick question on erroneous build

I made the mistake of defining a constant twice.

I deleted the second one.

Now the compiler can't find the original define.

When I change from "MinGW Speed" to "MinGW Debug" it compiles fine.

I've tried cleaning, rebuilding but nothing seems to fix the IDE now for this build. It refuses to see the #define statement.

Is there something else which can be cleaned to fully reset the compiler or is the heat getting to me?

Nick
