nixnix wrote on Wed, 09 May 2007 16:09I made the mistake of defining a constant twice.

I deleted the second one.

Now the compiler can't find the original define.

When I change from "MinGW Speed" to "MinGW Debug" it compiles fine.

I've tried cleaning, rebuilding but nothing seems to fix the IDE now for this build. It refuses to see the #define statement.

Is there something else which can be cleaned to fully reset the compiler or is the heat getting to me?

Nick

Hard to say, description too vague.

Anyway, "fully reset" -> you can use the "bomb" -> "Rebuild all".

Mirek
