Oops, this took longer than I expected.

Here comes the second try:

Errors and Warnings are now marked with different colors (red / yellow) in the small column where the breakpoint icon is placed.

Build and Rebuild automatically clears all existing error markers in all files

Compile File automatically clears all existing error markers in the current file.

Editing a line with an error marker will remove the error marker.

Error markers are moving with newly inserted lines like breakpoints.

In addition to the error/warning marking feature above:

I mark all lines edited since the last start of TheIDE in blue. I really love this feature and I'm very used to it from Source Insight. Very useful to find the places you have edited.

Makes use of existing data structures (breakpoints).

Hope you like it too!
