But I would prefer to have them allways slightly visible.

yes, you're right - that's what I thought but not wrote.

But if necessary I could add a hot key and/or toolbar icon.

That and option in configuration dialog to disable this future completely. Probably there is someone who doesn't like it

I'm interested in you quicktabs! This was another point which I consider improveable beside some other small things.

Just wait a few days. Concentrate on those small things Later we can improve my tabs if something missing/not working as expected.

Well, and what I really would like to have are some basic refactoring functions like renaming a class, function, etc.

But I guess I have to collect some more experion points with Ultimate++ before thinking about implementing it, but on the other hand the internal parser and the functionality from assist seems to be allready enough to try to implement it.

That would be fantastic!

I thought also about functions like add class (from user templates) to the project, add dialog to the project (this should add dialog.h dialog.cpp and dialog.lay files) etc.

If Mirek would implement block operations and improve c++ parser theide would be the best in the market
