
Subject: PostgreSQL fieldname case bug

The problem is that postgresql returns field names in lower case.

In the original version of PostgreSQL classes, there was a ToUpper() on field names, allowing using expressions like sql[FIELD_NAME].

In current version, ToUpper() disappeared, so I'm unable to get fields by name from a result set.

Put back the original version please.

in bool PostgreSQLConnection::Execute() currently it is:

```
f.name = PQfname(result, i);
```

but should be

```
f.name = ToUpper(PQfname(result, i));
```
