---

The problem is that postgresql returns field names in lower case.  
In the original version of PostgreSQL classes, there was a ToUpper() on field names, allowing using expressions like sql[FIELD\_NAME].  
In current version, ToUpper() disappeared, so I'm unable to get fields by name from a result set.

Put back the original version please.

in bool PostgreSQLConnection::Execute() currently it is:  
f.name = PQfname(result, i);  
but should be  
f.name = ToUpper(PQfname(result, i));
