Ok, i will try without documentation.

I will make some small projects to learn the package.
Maybe it is usefull to post them as examples?

But first i have to build the package but it seems something is missing or this is work in progress?

First i made for myself a list of dependencies (notation with '->') inside the geom package (only packages inside geom are shown):

- * Geom
- * Geom\Coords -> Geom
- * Geom\Coords\Ctrl -> Geom\Coords -> Geom
- * Geom\Draw -> Geom\Coords -> Geom
- * Geom\Ctrl -> Geom\Draw -> Geom\Coords -> Geom

When i build the packages this is the result:

- * Geom package: build OK
- * Geom\Coords package: build FAILED, class RefBase is undefined, package TCore does not exits.
- * Geom\Coords\Ctrl: build FAILED because Geom\Coords, this is a empty package.
- * Geom\Draw: build FAILED because of Geom\Coords, package TDraw does not exits.
- * Geom\Ctrl package: build FAILED because of Geom\Coords, package TCtrlLib does not exits.

I am using the 2007.1 release on linux.

What do you think should i take the Geom package from svn or didn't i get the whole release and do i need to install something additional?

Greetings,
Gertwin
