Subject: Assist++ "go to..." keys [SUGGESTION]

I've found more logical and convienent assignment of:

1. "Go to symbol definition" to ALT\_[,] which also has < sign.

That associates better with "go back" (\*.h file)

2. "Go to definition/declaration" to ALT\_[.] which also has > sign.

That associates better with "go forward" (\*.cpp file) and it's more convienent to navigate like an alternative combination to Ctrl\_[.]

And both these keys are more visually distinguishable and closer to arrow keys which you have to use in case you jumped into the wrong place...
