IMO the Assist++ should not be case sensitive because I prefer typing everything in lowercase and choose the correct casing from the code completion window. I did that in other IDEs I used and so I am missing it in TheIDE.

That's weird. AFAIK it is case insensitive. (it only orders matching case first)

Hmm oh yes basically you're right. But sometimes the variables and methods just don't appear when I type case insensitive and if I write them case sensitive they appear. Maybe the problem is not the case but sth else? But I can't tell at the moment. I will check what exactly I want to call and what happens in the assist next time.

Ok I found an example where it doesn't work: When I include something.
If I just type

#include <CtrlLib/Ctrll

nothing shows up.
I need to type

#include <CtrlLib/CtrlL

to be able to select it in the dropdown.
