Hi,

I've spent a lot of time trying this but I haven't achieved anything.

I need to create multiple objects. When I'll press each button, it'll open a window with different parameters for each button. I explain it:

1º When I'll press one button (for example, TABLA V-1) It'll open the window (second captured image) but wih different values that if I'll press "TABLA V-2" button.

2º I'll press each of DataPusher in the second window; it'll open the last window (trird captured image). It'll be the same for all values.

How I must to proceed to create the objects, methods and callbacks with a fast and short way?

* I've just added a simple example

Regards.
