## Subject: Tabctrl

Posted by arie on Mon, 28 Aug 2017 02:47:18 GMT

I am playing with the tabctrl but can't figure out how to use it properly in the visual designer.

I would like to add tabs to it and to align it with the main window (cover it).

Of course there is the possibility to just modify the source code but when there is a visual designer it should be possible to do it that way.

However, I don't see any properties I can edit (only 'Accept Current') and left or right clicking the widget doesn't show any menu in which I can change the layout and edit the tabs.

How do you do it in the layout manager?
