Hello,

I need to select an area of the screen and grab the text. I have seen we have a package to get screenshot. So perhaps its integration with an OCR should not be so difficult.

Does anybody knows some free OCR library?
In some old post I read few of us used Tesseract with U++. How was the integration of both tool?

Many thanks,
Luigi

PS: just now I recognised I missed "Corner". This post was intended for "Coffe Corner"
