on debian 9

latest upp

gcc 6.3, stdc++14

I've created a static library & header placed in my \$HOME/lib & include dirs.

I've updated <menu>[Setup](Build methods)(tab:INCLUDE directories) & (tab:LIB directories)

in <menu>[Project][Package organizer] I added Static library mylib (for libmylib.a in \$HOME/lib/)

The compiler finds the header no problem

the linker does NOT find the library

What am I doing wrong?

BUG-note:

I _accidentally_ put the name of the static lib in with the 'New libraries' and not the "New Static libraries"

and suddenly it all works.

Seems there is a bug concerning this...
