Subject: Project export bugs
Posted by mdelfede on Sun, 05 Nov 2017 10:10:35 GMT

Hi,

Exporting a big project (used packages + makefile) I found following bugs :

- makefile contains reference tu Turtle/xxx code (which looking into three is something about html5, not used by me).
Manually all references to it from makefile solves the issue.

- some packages are not exported, mostly bazaar and custom packages. For example the PolyXML package is not exported. Again,
copying manually the related folder to output directory solves the issue.

- Flags set by package organizer don't get exported/setup in Makefile. For example, I have a linker option -DHAVE_CONFIG in a
package (one of the not exported packages, but referenced in Makefile) named Archive.
Makefile contains
Macro_Archive = $(Macro)
and not
Macro_Archive = $(Macro) -DHAVE_CONFIG_H
Manually modifying the makefile again solves the issue.

Btw, the makefile export is really a great addition... I did not notice it up to now! :p
