Hi Guys,

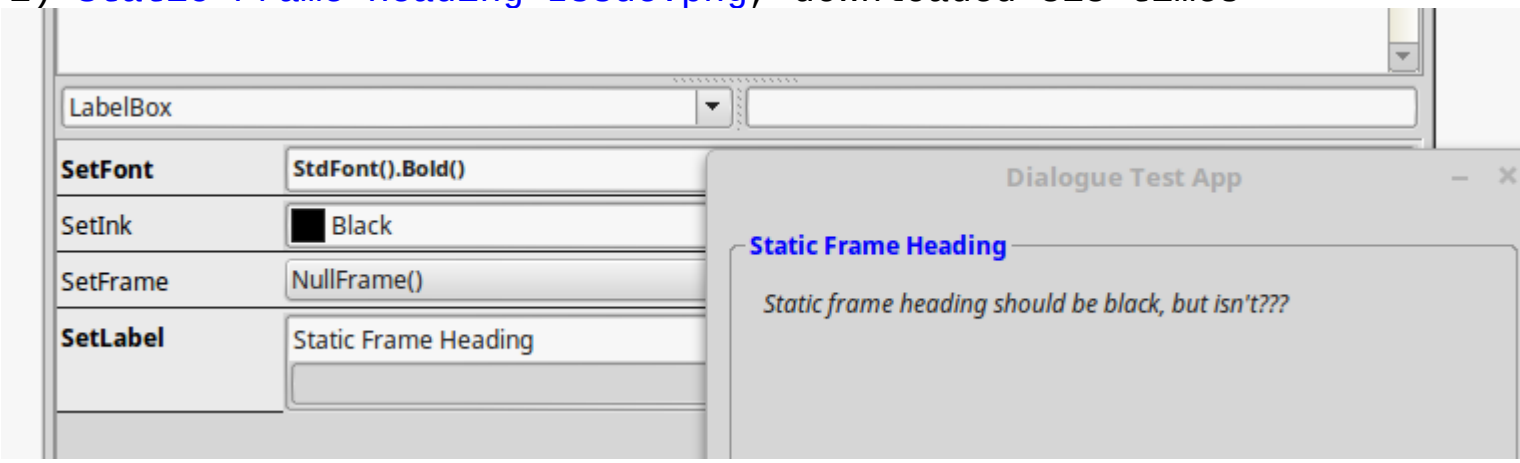

When making use of the U++ layout editor and a LabelBox, and providing a label with the SetInk value set to it's default value of Black, why does the label display in in Blue? Here's an example:

If I specify another color value, the label displays in that color. When selecting the default value of Black again, the label displays in Blue again.

Peter

Hello,

It seems that the value is not taking into consideration while initializing the control. Currently, I do not have time to dig, but if you want to you can debug the issue on the CtrlLib site. Current stable version of TheIDE have polished debugger on Linux platform, so debugging shouldn't be painful. However, I wish it works better. But for now, it is usable.

Alternatively you could try to set the color from the code. If you have problem with obtaining LableBox just select name for your UI component. Please verify that it is possible and let me know.

I created ticket for your issue #1826.

Sincerely and have a nice day,
Klugier
