Hello all

I think that the U++ applications seem blurred in Windows 10.

Other applications like Office, Adobe Acrobat or Firefox look perfect in the same screens.

This is an example. Is there any parameter to solve this?

Hello,

We need more information like your desktop resolution, dpi etc. It is important, beacuse when we detect that there is 4K or 8K resolution we run in another GUI mode that scale the interface, so it might be the problem.

However, I used U++ with Windows 10 with FullHD resolution and I didn't find any issue related to blurry. The other clue is the font used by us.

Sincerely,
Klugier

Hello Klugier

The problem matches exactly with this report.

The problem appears with 3 monitors with different scales. It did not appear with Windows 7.

Well, it seem it is not a simple problem. In fact, it seems that even Microsoft has not solved it well for its own applications. It seems Microsoft does not know how to handle well a Desktop valid for tablets and for computers.
Anyway, it seems it is necessary that the W10 applications have to have "DPI awareness".
In addition, it would be interesting to use "Manifest" file in W10 applications.
