I think its time to show my last achievement and reveal my secrets . In the attached package are present many technics I've learned during last 2 months in this forum thanks especially to Aris (that kept me here while I was escaping after some bad moment with C++ , that wrote for me important piece of code) and Mirek for answering all my questions covering undocumented aspect of U++.

The application regards a program for the administration of a chess tournament. The previous and stable version is here <http://www.vegachess.com> The current U++ version regards at the moment only the round robin system. The swiss system will be translated in future. Anyway the missing part concern only calculation and not the GUI aspect that are relevant for this forum and are alredy present in this version. For the user manual please refer to that of the previous version in that the function are almost idendical.

Some screenshot can be seen here: <http://www.vegachess.com/en/vega5rr.htm> . I hope this can be useful for U++ beginner. Just unzip Vega3 folder and compile. Any feedback will be appreciated.

Luigi

Luigi

Hello,

the link to the package is broken and I've not another copy since the crash of my hard disk three months ago.

Please let me ask to post it again if somebody had saved a copy in the past. It is not a big lost but a chessfriend and potential U++ user wanted to have a look at the code.

Thanks,  
Luigi

looks like something got into webarchive:

[http://web.archive.org/web/\\*/http://www.vegachess.com/en/veg a5rr.htm](http://web.archive.org/web/*/http://www.vegachess.com/en/veg%20a5rr.htm)

edit: well, the screenshots are sparse, but if you dig into all dates, you will find some in big resolution too.

But backup it soon, the webarchive is not a very good backup in terms of images.
