Subject: GridCtrl - Get() with sorted rows

Hi,

I think I've asked this before but I can't find this in the forums anywhere so I'll ask again (maybe).

I would like to be able to use Get with sorted rows and know which original item I am accessing or to be able to simply access the original items in the order that I put them.

If it doesn't already exist, something like the function Value GetUnsorted(int r,int c);

I feel sure that this functionality already exists but I can't find it.

Thanks,

Nick

I see there is GetSortOrder but it uses Ids whereas I just want to index by the original row indices.

Not urgent as I've found a way around it but this seems like a logical addition to GridCtrl in my opinion.

Hi Nick,

Can you post your solution.
