Hi all,

With the newest version from svn I am unable to compile ide. Some relatively new changes are breaking compilation. I wonder anyone has that problem?

I solved it. I had to first checkout older version of sources with message "ide: .m and .mm now only compiled on macos or with OBJC flag". Then I compiled ide. With this ide I compiled the newest sources.

Everything went smoothly except error in setupSVN.cpp: namely there was wrong function `usedGetHomeDirectoryFile()` instead of `GetHomeDirFile()`
