The last thing to implement is "apple-style" application menu. I have it almost done, except one little issue, which is summarized here:

https://stackoverflow.com/questions/52632984/minimal-cocoa-application-problem-with-menu/52636196?noredirect=1#comment92207333_52636196

(while it is nice to know this is probably Apple's bug, we still need a workaround...)

So I am bringing it here in hope that somebody perhaps picks this up and finds solution...

Mirek

Found it! Binary has to be in Contents/MacOS - then all works as expected. In practice, this means that GUI builds will have to create application bundle to fix the problem, but I have planned that anyway...
