Here's a bit of code that populates a DropDownList and selects one of the options to display as default value:

```
dropList.Add("Cows");  
dropList.Add("Apples");  
dropList.Add("Cars");  
dropList.Set("Cars");
```

Initially when the drop-list displays, "Cars" lists as the default selection. Upon selection, "Cars" still lists, followed by the drop list of values, Cows (highlighted), Apples, and Cars. When focus is removed away from the drop-list, the original selected entry is cleared.

Now, if a selection was made from the drop-list was previously user selected, and the drop-list is selected, followed by focus being removed and the drop-list collapsing, the previous selection would continue to display.

Why is this behaviour happening?

Peter

Wrong method. Use SetData or operator<<=.

Thanks Mirek!

Incorrect method, yes. The documentation mentions the SetData / GetData methods only in passing, in the paragraph at the top of the page. Probably should list it in amongst the other Public Methods!

Yeah, well, it is because it is so "central" feature of U++.

If widget holds single value, it has SetData/GetData. And you are supposed to always use ~ and <<= (or SetData/GetData if you have operator overloading phobia, but then it is unlikely that you would like U++ :)
