Hi there,
is there a way to getting the SQL statement upp is going to issue, without actually execute it?

For example the following code will produce (in PostgreSQL) the SQL statement "insert into PERSONS(NAME, SURNAME) values ('John', 'Doe')" and will execute the query:

```
try {
    SQL & Insert(PERSONS)
        (NAME, "John")
        (SURNAME, "Doe");
} catch(SqlExc) {
    ErrorOK(t_("Failed adding data to the database due to the following error: ") +
SQL.GetLastError());
}
```

What I would like to have is a way to have the statement "insert into PERSONS(NAME, SURNAME) values ('John', 'Doe')" in a string variable, without actually executing it (so I will not find a new record in the db); is there a way to achieve this?

Thanks,
gio

I'll bump this years later. I'm also interested in doing this!

Help?   :d
