Good morning,

I want to read a table which have a field with same name as the table :

```
TABLE_(SCRIPT_CONTENT)
   INT (ID) PRIMARY_KEY
   INT_ (SCRIPT_ID)
   STRING (SCRIPT_CONTENT,10000)
END_TABLE
```

Don't ask me why, it's like this, sorry.

Of course, i have some problems to read it.

Should you have an idea?

Thank you very much.

Best regards.

There should be no problem (the only slightly trick part about '_' being the command to declare SqlId you seem to have gotten right). What problems do you have?

Mirek
