Subject: [Skylark][witz] How would you do this

Suppose in a witz

<a href=$Handler(v)>$Title</a>

Will produce in the resulting html document something like this

<a href="/display/1">Some Report</a>

My intended result is something like

<a href="/display/1.pdf#page=3">Some Title</a>

Basically, I need to put some text in the quoted text created by $Handler(v).

In my case $v and $Title are actually key and value of an entry in a ValueMap. I have attempted to make $v = "1.pdf#page=3", but don't know how to prevent it from being HTML escaped.

What's the suggested way of achieving the intended result?

I use javascript to resolve the issue. Something like

$for(i in MyMap )
<a href="#"
onclick='window.open($MyHandler(i._key)+"#page=3&view=FitH","_blank")'>$i</a><br/>$endfor

Hi Lance,

Sorry for late reply... I believe that proper way to solve is to either

1) use raw function from witz standard library in your template

or

2) use Raw() in your code, to let the engine know that your value should not be escaped

I haven't use this in quite a long time, so I'm not exactly sure if it really fits into your scenario. But it should still work in general case.

Best regards,
Honza

Hi Honza,

Thank you for the reply.

I actually tried raw() but cannot achieve what I intended. I tried various ways but could not figure it out.
