Hello,

when executing a `sql.Execute()` command I have problem if the content of some string has the single quote `'`. Perhaps other characters may give problem. Do we have a method that treat the string preventing error and let the string to be shown correctly?

Thanks,
Luigi

You shouldn't embed your string into an SQL statement. Use parameters instead. Example (Sqlite):

```
String oc_name = "Can't do that";
Sql sel(dbs);
sel.SetStatement("SELECT id FROM lemma WHERE oc_name = ?");
sel.Run(oc_name);
```

Another useful method to use is `Sql::SetParam`.
