Mirek please look at the example attached to this post.

1. If you run the program and press the toolbar button the array control placed below it should be filled with 1000 rows. After that you can leave the program. Everything is fine.

2. Now if you move the mouse over the toolbar button and wait until tip shows and now if you press F5 (button shortcut) the array should be filled again but the button tip will stay and closing app will cause critical error.

I don't remember if upg gui is thread safe - anyway, is any solution for my problem?

No, GUI is not thread safe in sense that you could have more than single thread performing GUI operations.

Anyway, the solution is to use event queue which is synchronized (MT safe). See [reference/GuiMT....](#)

BTW, nice explaining thread:

<http://lists.trolltech.com/qt-interest/2005-03/thread00880-0.html>

(in other words, for X11, this is the best option...)

Thanks! Just like I thought - just have to use postcallback. (Interesting is that calling gui routines from threads (in win32) works fine (at least in my app) execept these popups).

Unpleasant thing about race conditions (and mutlithreding programming) is that they happen unpredictably... In some cases, once per month...
