It would be great if the jsonb type returned to C++ code as Value. Conversely, Value might be accepted into the database.

Now we have to use ParseJSON and StoreAsJson, which degrades performance

For example:

```
Vector<Value> row;  
sql.Fetch(row);  
ValueMap v = ParseJSON (row[0].ToString()); //this is the jsonb type in the database, but  
IsString(row[0]) is true  
// ValueMap v = row[0]; // a good way, I think
```
