Hello community,

I'm looking for something like this :

```
Vector<String> m;  
String& find = m.GetIndex([](String toFind,String inMyVector){return  
toFind.IsEqual(inMyVector);});
```

It allow me to retrieve index of object by calling lambda function.  
Do it exist ?

Thanks in advance.  
Best regards

Here is how I did it  
#include <Core/Core.h>

using namespace Upp;

```
template <class T>  
T& FindOne(Vector<T>& data, bool(predicate)(const T& t2)){  
    for(T& t : data){  
        if(predicat(t)) return t;  
    }  
    throw std::exception();  
}
```

```
template <class T>  
Vector<T> Find(Vector<T>& data, bool(predicate)(const T& t2)){  
    Vector<T> buffer;  
    for(T& t : data){  
        if(predicat(t)) buffer.Create(t);  
    }  
    return buffer;  
}
```

```
CONSOLE_APP_MAIN  
{
```

```

Vector<String> allStrings{"one", "two", "three", "four", "five", "six", "seven", "eight", "nine"};
try{
    String& theStringFinded=FindOne<String>(allStrings, [](const String& s1){
        return s1.IsEqual("six");
    });
    Cout() << theStringFinded << "\n"; //six

    auto result = Find<String>(allStrings, [](const String& s1){
        return (s1[0] == 'f');
    });

    for(const String& res : result){
        Cout() << res << EOL; //four;five
    }
}catch(...){
    Cout() << "Error" << EOL;
    return;
}
}

```
