Hare Krishna, All!

I wrote with Your help and the help of other programmers who somehow participated in the U++ and Mingw-w64 project and also my friend the site administrator <https://vedabase.io> and the entire team of this site the program of the dictionary of the founder-Acharya of the International society of Krishna consciousness Sri Srimad Abhay Charanaravinda Bhaktivedanta Swami Prabhupada, which is compiled on the basis of his books published in different languages of the planet!! My friend Abhinanda Prabhu inspired me to write this program.

I want to put it in bazaar. Help me, please! I need access to SVN and simple instructions. I attach a file with changes to the U++ source code to the letter .

<https://github.com/Navadvipa-Chandra-das/PrabhupadaSlovary>

I hope that these U++ changes will be accepted.

With best regards, Navadvipa Chandra das/

Hare Krishna, All!

Mirek said that there are many people here who can force him to make changes. But he's busy right now. Therefore, I ask You to listen to my questions and then advise Mirek something.

In order. I wrote the program Srila Prabhupada's Sanskrit dictionary -

<https://github.com/Navadvipa-Chandra-das/PrabhupadaSlovary> . His Divine Grace Abhay Charanaravinda Bhaktivedanta Swami Prabhupada - the Founder-Acharya of the International Society for Krishna consciousness!

1. To compile it, you need to change the ArrayCtrl files.h and ArrayCtrl.cpp . I can't make these changes in my program, because the ArrayCtrl component doesn't provide editing capabilities for virtual columns.

Added a setter functor for columns and an Inserter for ArrayCtrl.

2. To the Algo file.h added an algorithm for removing duplicates from a sorted container that supports the indexing operation-V[i];

```
template < class SortRange >
void RemoveDuplicates( SortRange& V )
```

```
template < class SortRange, class OnRemove >
void RemoveDuplicates( SortRange& V, const OnRemove& On_Remove )
```

two options - simple and with a special trigger for deleting an item, as in databases.

3. Added a conditional delete algorithm for the Vektor and Array classes with a delete trigger, as in databases

```
template <class Condition, class OnRemove>
void Removelf(Condition c, OnRemove On_Remove);
```

These are the main changes.

4. Put the program in the Bazaar and get access to the Bazaar for modification.

Thank You very much!
Hare Krishna!

With best regards, Navadvipa Chandra das.

Hare Krishna, All!

The Prabhupada Dictionary program compiles perfectly and works on Windows, but does not work on Linux. It cannot open the SQLite3 Sanskrit.db database . After compilation You need put in place in the executable folder the following files and folders - the Text folder and the Sanskrit.db and PrabhupadaBukvary.txt . Also for the program to work, You need to install the Gaura Times font.

Also, for successful compilation, you must replace the files in the Ctrllab - ArrayCtrl package.h and ArrayCtrl.cpp .

The second problem is when compiling the PrabhupadaSlovary.icpp file for Linux . It is added to translate PrabhupadaSlovary into different languages! Here are its contents:

```
#include "PrabhupadaSlovary.h"
```

```
//#include "PrabhupadaSlovary.cpp"
```

```
namespace Upp {
```

```
#define TFILE <PrabhupadaSlovar/PrabhupadaSlovar.t>
#include <Core/t.h>

}
```

Even in Windows I sometimes had to comment on the line:

```
#include "PrabhupadaSlovar.cpp"
```

And sometimes you have to remove the comment from this line.

In Linux, in the release compilation mode, compilation with the PrabhupadaSlovar.icpp file is not possible for all variants! We have to exclude it from the project! What's wrong with the PrabhupadaSlovar.icpp file ?

Fedora 31, Ultimate++ 15155 .

<https://github.com/Navadvipa-Chandra-das/PrabhupadaSlovar>

Hare Krishna!
Thank You!

With best regards, Navadvipa Chandra das.
