Hello,

I had a working script
 https://www.ultimatepp.org/forums/index.php?t=msg&th=108 01&start=0& (see below)

```
void fileupload::Upload()
{
    String url = "http://localhost/uploads/transfer.php";
    HttpRequest r(url);
    String fn = "C:/upp/out/MyApps/MSBT17.Gui/test.pdf";
    String s = LoadFile(fn);
    r.POST();
    r.Part("file", s , "multipart/form-data", fn);
    r.Execute();
}
```

able to perform a file upload.
Now the same script must work on a new server that manage the https protocol. Unfortunately it
no longer works (perhaps some bad server setting).
I wonder if the previous script could have problem in case the server accept HTTPS.

Thanks,
Luigi

EDIT: the problem was solved by Oblivion in another related post.
I missed to add Core/SSL package to the app, and #include <Core/SSL/SSL.h> in the source
code.
