Subject: [Proposal] Markdown to QTF converter/parser

View Forum Message <> Reply to Message

Hello,

I've been thinking about this for a while.

Markdown format has gained a lot of traction in the last few years.

I think U++ and TheIDE can benefit from this (for example, TheIDE or any U++ app using QTF
can display markdown formatted text it its intended form, using a MD -> QTF conversion).

To this end, I propose encapsulating the MD4C ("Markdown for C") library.

It does not take much space, comes as a single header and source file, is multiplaform (Win,
POSIX), easy to encapsulate, and very fast.

It has MIT license.

Here is the MD4C's github link: https://github.com/mity/md4c

What do you think?

(I can get it ready for U++ 2020.2 release)

Best regards,
Oblivion

I would be happy with that.

Ok,

I have started implementing the parser. Hopefully the first official version of it will be available around September if not earlier.

Best regards,
Oblivion

That would be great, as we could have the same help files visible in GitHub and U++ web portals, and in U++ apps. :)

Yeah, well, but we would need QTF->MD for that I guess instead :) Which is doable too, but harder.

MirekAt least, the MD->QTF is good for the new helps.

Hi,

A small update and news:

The MD -> QTF converter plugin/wrapper is progressing nicelty.
All the basic stuff (headers, character styles, URL and image links) is done. The more complex stuff (lists & tables) have proven to be somewhat more difficult to convert to qtf. (they can contain more elements than what qtf allows), but there is progress on that side too. So, at least a primitive form of table and list support will hopefully land in first release. Not to mention that I am working on qtf styles supports for md blocks and spans.

A screenshot of the early wersion of -possible- reference example (MarkdownEditor):

Best regards,

Oblivion

Hi,

Another small update/nws.

Markdown to qtf converter is progressing nicely.
After some wrestling with "loose" lists, I have managet to map complex DOM model to qtf.

A screenshot:

Unfortunately the package won't be available in the upcoming upp 2020.2 release. But I'll probably
send the initial version in couple of weeks.

Best regards,

Oblivion

What is the status? I feel like this would be useful with UppHub.... (we could display github readme in theide)

Even partially working solution would be fine for now.

Mostyly done, except image loading mechanism, styling api and some cleanup. If it's OK, I'll upload it with the editor/converter example on next monday or tuesday (21-22), after I cleanup the code this weekend.
Then I'll start working on completing the missing parts.

Best regards,
Oblivion

Hello Mirek,

FYI, I have delayed the initial release several more days.
The reason is I couldn't find time to finalize it earlier and I don't want to publish a sphagetti-code

just because "it works".
I'm in the process of streamlining it, and I'll release it, this weekend.

I am really sorry for the delay. And thank you for your patience.

Best regards,
Oblivion

Good news!
It would be useful for me also. I'm almost at the point starting to code my own parser.
BTW, your OAuth code is extremely useful in one of my a projects also. I added some extra to it.
Are you open to get my paches to that?

Don't bother, It is almost ready. You don't want to dive into that hell. :d

Are you open to get my paches to that?

Sure, I'd be more than happy to enhance the OAuth code and receive contributions (which you will be credited for)!

Best regards,
Oblivion

OK, I palan registering to github to be able to send you pull requests. Or is it enough for you if I save my commits to files and send them to you in PM here?
The changes are made to be able to use it with Google in a desktop app, signing in to send emails.

The changes are made to be able to use it with Google in a desktop app, signing in to send emails.

You don't need to sign in to GitHub for that, you can simply upload the modified package via a message to Bazaar OAuth topic: https://www.ultimatepp.org/forums/index.php?t=msg&th=104 12&start=0&
(Let's continue there :))

Best regards,
Oblivion

Hello Mirek,

Please find attached the "technical preview version" of Markdown package. (Let's call it that until we fix the remaining issues (before 2021.1 release))
Package contains:

- Markdown package
- Markdown Editor Example

Markdown package contains the latest version of md4c library.
It lacks documentation, for the time being. I will add it in the following days. However, it is so simple to use, documentation is hardly required.

Current issues and todo:

TODO:

- Image handling is yet to be implemented.
- Task lists are yet to be implemented.

Remaining issues:

- Block elements don't have configurable style.
- Page properties (margins, indentation, etc.) are not configurable.
- Soft break is not handled very well

The Markdown editor example is a so-called "real-time" editor in which you can
design/test/load/save/export markdown documents in real-time. (it reacts to key-strokes)

It is what I use to test markdown package.

If you can grant me SVN write permissions to package location after adopting the package, I'll fix
the remaining issues and maintain the package.

Best regards and a happy, productive new year!

Oblivion

Very nice. I did a simple markdown to RichCtrl a year or so ago using PEGTL, so it would be nice
to see something more complete.

It is now used in UppHub to display README.md. Unfortunately, to do that, I needed it in uppsrc
(so that theide compiles from uppsrc), so moved it to plugin/md....

Hi,

I have added image span handling to plugin/md. It should be available with U++ nightly builds.

Summary:

U++ md plugin does not render images or recognize any image format. It is up to client code to render and manipulate images. This is done via an event:

Event <VectorMap<String, String>& > WhenImages;

The md plugin will parse/collect the image data of a given md document and hand them to the client code as a string map via the WhenImages event.
The keys of this map are image URLs whereas the values are meant to be filled with some QTF/Richobject data (as qtf).

In this way, the client code can [down]load and manipulate the image data as it sees fit (e.g. it can simply substitute a qtf text on image loading/retrieval failures, or blacklist images from certain domains, or put decorative frames around images, using tables etc...)

This method also allows MT or async calls for image [down]loading and rendering, as it passes to client a complete list of available image span info at once.

Now, the map values can certainly be filled with the "whole" image strings, but this is usually not desireable, as it makes the document larger after a couple of images.
Instead you can use an array of RichObjects to keep the real image data in a cache and only pass the serial/pointer as the map value, using the QtfRichObject() function, for example.

If you have any questions, suggestions etc., let me know.

Best regards,
Oblivion
