I have suspicion that Win32 GDI is not HW accelerated anymore. Anybody with Windows and a bit of time, can you please test this:

#include <CtrlLib/CtrlLib.h>

using namespace Upp;

GUI_APP_MAIN
{
 DDUMP(GetDeviceCaps(GetDC(NULL), SHADEBLENDCAPS) & SB_PIXEL_ALPHA);
}

(If you do, please also send info about Windows version and your GPU).

Mirek

Hi,

This returns zero for me. Windows 10 professional x64, Intel core i7 integrated Intel HD 4600 graphics.

Best regards,

Tom

Hi Mirek,
In my case it looks like the same as for Tom1 - I've got a zero.

GetDeviceCaps(GetDC(0), 120) & 0x00000002 = 0
TIMING DarkTheme   : 8.00 ms - 135.58 us (8.00 ms / 59), min: 0.00 ns, max: 1.00 ms,

nesting: 0 - 59

Win10 (1903)
CPU: Core i7-8550U
GPU: Intel(R) UHD Graphics 620

Regards
Przemek

I have exactly the same output on an HP Zbook with the laptop screen (which suspect always uses the HD Graphics 4600)
I will test with another screen tomorow since I also have an Nvdia Quadro K2100 in my Zbook

Thanks to everybody, I think at this point more testing is not necessarry. The result is that in current Windows, GDI is not HW accelereated, or at least it is not reported as such by API.

Hi Mirek,

Same result with my K2100 and external screen (I checked that it was really this GPU that is used)
