Hi all-

In the SqlApp examples on Ultimate site,
SqlApp is always in the same scope. I have a class MyMain, Class2, Class3 etc.
How can I get the MyMain::SubMenu to call a menu located in a different class, so I can use different class functions? I put a menu on the main form and on the layout for the different class.
Thanks! roboloki

```
void MyMain::SubMenu(Bar& bar) {
    bar.Add("Subsidiary", [=] { showciti();});
    bar.Add("Purch. Journal", [=] { showpj();});
    bar.Add("Exit", [=] { Exit(); });
}
void MyMain::MainMenu(Bar& bar) {
    bar.Sub("Menu", [=](Bar& bar) { SubMenu(bar); });
}
```

HI all-

Never mind. I figured it out. It is very cool. Thnx! roboloki
