I think we should definitely do some changes to how bazaar is handled. Many current packages are unmaintained and broken. And we also have a problem with git, where I cannot set write rights to just bazaar.

So I propose following steps (not immediate, definitely after the 2020.1 release):

- move bazaar out of svn, to github. Maybe even into multiple github projects (probably will end as single bazaar for less often update packages and I expect agile contributors to move theirs packages to separate gits)
- the release process will then pick bazaar packages from gits
- there will be whitelisting process, package will need to compile in posix and win32 to be accepted

Mirek

Hello Mirek,

Sounds good : separating maintained code from unmaintained code is important :)

But having all in one place is also very practical : if you are searching for some code example you can always search in bazaar and find all sorts of things : good and bad ;)

We will at least need the following if we don't want to lose new users :

a home page that lists all the child projects and an 'all-download script (maybe to recreate something like bazaar )

Ideally your whitelisting process should also keep track of last Upp version the project compiled with : just to be able to detect kick-out candidates

I agree with both of you :)
