Does this issue fixed?

https://github.com/ultimatepp/ultimatepp/issues/18

Please let me know if there is any works on it. I currently can't test it on my OI installation. There is a bug that prevented me from update my system and installing the necessary toolchain:

https://www.illumos.org/issues/12964

Hi,

I tested IDE build with provided VirtualBox image of OpenIndiana. I was able to build the IDE but there were some problems:

1. I used upp_cmake script to generate CMake project files. Problem was with SOLARIS flag. This flag is not properly set in all UPP packages. So I had to set CMAKE_SYSTEM_NAME to Linux in the main CmakeLists.txt file "set (CMAKE_SYSTEM_NAME Linux)" to built the IDE.

2. After that another problem appeared - link failed due to missing link library "socket". This can be fixed with latest version of upp_cmake which contains new optional configuration parameters PROJECT_EXTRA_LINK_FLAGS to add another library to the project. Or update proper UPP package definition to link socket library when OS is SOLARIS (see next point)

3. Another problem was with libraries order for OpenSSL linking. You have to change file uppsrc/Core/SSL/SSL.upp and set library section to "ssl crypto"

4. Last problem with the IDE build was in uppsrc/plugin/ndisasm. I hade to comment out "#include <stdlib.h>" in these files: uppsrc/plugin/ndisasm/lib/nasmlib.c, uppsrc/plugin/ndisasm/lib/snprintf.c and uppsrc/plugin/ndisasm/lib/sync.c

The IDE was built successfully with all these changes. But this workaround works only for the IDE.

This is not solving your problem but it can help you to move forward. You must solve main problem which is described in point 1 - SOLARIS flag is not properly set in all UPP packages. And if you need fully functional build of other UPP projects/packages under SOLARIS OS you have to update all affected UPP packages.

And I'm a little worried that there won't be anyone here who would officially take care of the proper support of the OpenIndiana system, if you're the only one I know of yet. But I may be wrong.

BR, Radek

Hello,

It seems that we need to handle OpenIndiana as Solaris in our linking matrix and it should work. It will probably require some work in Core/config.h (link). Can you check that "__sun" is defined by OpenIndiana?

Of course firstly we need to fix platform detection process in the makefile. For more information please visit https://www.ultimatepp.org/forums/index.php?t=msg&goto=5 4456&#msg_54456.

Sincerely,
Klugier

Hi,

I've prepared basic SunOS support for the IDE build. Take a look at attached patch.

BR, Radek

```
File Attachments
1) SunOS.patch, downloaded 276 times
```

Hi,

I found problem with IDE building on OpenIndiana so next patch must be applied too.

BR, Radek

```
File Attachments
1) SunOS_2.patch, downloaded 267 times
```

Hi gh_origin,

I've updated my fork of Ultimatepp with proposed patches so if you are interested in to test the different approach of IDE building (or another UPP package building) you can do that using the following commands. This approach should be working on different OS too.

git clone https://github.com/CoolmanCZ/ultimatepp.git
cd ultimatepp
./bootstrap
./GenerateCMakeFiles.sh
mkdir build.ide && cd build.ide && cmake .. && make -j 4

I've prepared basic SunOS support for the IDE build. Take a look at attached patch.

BR, Radek

Do we really need PLATFORM_SUNOS? I think PLATFORM_SOLARIS is enough. If there are differences, just make it work for OpenIndiana...

Hi,

Fortunately I still have the archive of OpenIndiana provided by gh_origin. The question is where should I upload them?

BR, Radek

How big is it? Generaly anywhere I can download it from...

Hi,

You are right, we dont need another flag. My mistake.

BR, Radek

Edit: And changes related to the ndisam plugin are also not necessary.

OK, so I have it basically working as well and getting ready to support it in install process.

The one problem remaining is with automated dependency installation of install script:

pkg install bash gmake gtk3 libnotify clang-devel

(above is created for freebsd, where it works)

openindiana is unable to install gtk3 and clang-devel here.

How should this be fixed to support it?

pkg install bash gmake gtk3 libnotify clang-devel

It looks like this is the answer:

pkg install bash gtk3 libnotify developer/clang-80 gnu-make

On OpenIndiana, gtk3 is already available (it's using MATE, a gtk3 based DE). You should replace clang-devel with build-essential. The default compiler on OpenIndiana is GCC7, it's included in build-essential. OI also uses bash as it default shell, so you do not need to install it. gmake is included in build-essential (as I recal).

So the command should be:

pkg install build-essential libnotify

As I recall, libnotify is already available, too. But I'm not sure, so just keep it there.

If you want clang, you can query the package name with pkg search -rp clang and choose the version you want to install, there are clang 8 and clang 9 (as I recall). You can install newer GCC version, too. Just query the package name with pkg search -rp gcc to know the exact package name.

Thanks.

One little annoying thing is that if all packages are already installed and pkg takes no action, it returns exit code 4 and install script reports problem. Any chance to fix that without introducing some mechanism of "allowed exit code" into install script? Like some pkg commandline option?

Other issue is that while testing our examples, there seems to be some issue with socket implementation; in OpenIndiand I am getting some socket transport endpoint errors; it works fine on other platforms. Does that ring some bells?

In 'parallel' develeopment (to ./install script and install tarball), in source tree there is now ./configure script that should 'fix' the makefile to work in opensolaris (fixes for BSDs coming... - actually the most work there is to install these in virtualbox...)

Usually, all opensource OS are available preinstalled in VM. You just need to download an image. IMHO, Vagrant is a starting point.

I have the feeling that there must be a library of preinstalled virtualbox images somewhere. I just fail to find it... :)
