Subject: Cannot Debug Modal
Posted by steveo on Fri, 11 Dec 2020 22:25:59 GMT

If I run the debugger, and set a break point in any code that executes during a modal then the application locks up and becomes unresponsive. It also takes over the mouse and most of the keyboard. The only way out of this is to have an already open terminal, execute ps -efwww find the running process and execute kill -s kill PID for the process being debugged.

This even happens in code that executes after the modal dialog has processed the RejectBreak or AcceptBreak functions.

Is this expected behavior?
