Subject: UppHub / Plugin directory
Posted by Didier on Mon, 01 Mar 2021 10:12:23 GMT

Hello,

After reading the UppHub instractions here
https://www.ultimatepp.org/appideUppHub_en-us.html, It says all packages have to be root or
in Plugin directory

I would like to have a directory in which all addons specific to my package would be grouped
(instead of beeing mixed with all others in the plugin directory).
This enhances readability a lot

Is there a real reason for restriction about Plugin directory ?

(instead of beeing mixed with all others in the plugin directory).
This enhances readability a lot

Is there a real reason for restriction about Plugin directory ?

No. The wording there should be changed. I think the really important bits are:

- do not mix packages in single UppHub nest that are solving different problems (like mixing
SysInfo with STEM4U).
- try to make sure the package names that are to be used are unique (obvious reasons) - does not
apply the name of examples, tests and other main packages that come with nest.
- if you are adapting 3rd party code (or perhaps format), consider putting it to plugin (like
plugin/md).
- put examples into examples directory
- put U++ style tests (those that can be be compiled / run automatically and fail with non-zero exit,
e.g. with ASSERT) into autotest directory
- put other tests to test

Thank you Mirek,

it's clear now
