in the class SSLContext (Web/SSL) there is a method "VerifyPeer" to set wether the peer of the SSL connection should be verified, but I was unable to find a method to set the verify_locations.

I have searched all files for "SSL_CTX_load_verify_locations", but none found.

Its not that bad, because one can ease do it by calling the original SSL_CTX_load_verify_locations, but imho its cleaner to have such a method within SSLContext

greetings and thanks for the great work,
falling
