Hello Mirek,

I think we should remove this package from UppHub. The reason for this - it is broken on the begging and I assume we do not want to have packages that doesn't work on UppHub.

UppHub package make sense when it has maintainer. In other cases it should be removed from UppHub and set as outdated/broken. I am not interested in this package and I can not find places when XMLMenu should be used over standard menus. If Massimo is not interested then we should remove it... Simple, but true. We need to move forward and forget about deprecated/incompatible packages from legacy bazaar.

Klugier

What we really need here is UppHub tzar or steering committee or something, which is not me....

One reason for UppHub was that I do not have capacity to be involved in bazaar. Unfortunately, it turns out that by helping with the move, I am more involved than ever.. :(:)

I really need to be concentrated on uppsrc and theide...

Hi,

I'm using XMLMenu on a couple of my applications, but on last 2 years I had few time to code, so I let all my packages alone.

I'm thinking to grab them again and fix in short, but can't tell exactly when...

If you thing you should remove XMLMenu from upphub, just do it. If you prefere to fix it (it should be trivial...), just do it.

I'm convinced that a dockable menu system is useful, but I may be wrong.

I've seen now that some other stuffs from me (like PolyXML) are used in other packages, so they should stay in upphub, or embedded somewhere else, if you prefere.

Best regards

Massimo

Thanks!

For some reason it is not supported on Mac. Theoretically, it shouldn't be a big problem to port it to Mac ...

Unfortunately, there seems to be platform specific code in XMLMenu which is not implemented for macos.

Hopefully somebody will fix it over time...

The problem is in drag'n drop behaviour, which is quite platform-dependent.

I'll give a try soon or late, but don't expect it to be fast.

It was already difficult to implement for windows and linux...

This works in Win32, but not yet in Gtk/Macos:

```
struct DragTest : TopWindow {
    Rect r;
    bool dragging = false;
    void Layout() override {
        r = GetRect();
    };

    void Paint(Draw& w) override {
        w.DrawRect(GetSize(), White());
        w.DrawText(100, 100, AsString(r));
        if(dragging)
            w.DrawText(100, 130, "Dragging");
    }
}
```

TimeCallback tm;

```
DragTest() {  
    tm.Set(-10, [=] {  
        Rect rr = GetRect();  
        if(r != rr) {  
            r = rr;  
            if(GetMouseLeft())  
                dragging = true;  
            Refresh();  
        }  
        if(!GetMouseLeft()) {  
            if(dragging) {  
                dragging = false;  
                Refresh();  
            }  
        }  
    });  
}
```

But the problem is only that GetMouseLeft is not properly updated for timer proc; I think I can fix that and actually SHOULD fix that anyway.

I believe that above functionality is all that you need.

Mirek
