Hello U++,

I have spent time looking at vulkan and trying to do some thing with it. As a U++ user, I have think out how I could implement it into U++ to provide at least a Vulkan Ctrl.

The task of providing a simple Vulkan Ctrl which is capable of printing a Vulkan pixel buffer into the screen should not be that hard. However, I think it would be better to provide via this vulkan implementation a complete set of all tools used to developpe under Vulkan.

Thoses tools, normally provided by the LunarG Vulkan SDK are really important in the developpement cycle of a typical vulkan application. That's why, when, as user, I think about going onto UppHUB to download the VulkanCtrl, I'm expecting to have all tools to developpe vulkan application using this Vulkan Ctrl.

In this idea, I'm wondering if it is possible, nor usefull, to implement in TheIDE a way to download file (like this SDK) and install it (by asking permission to users obviously).

By adding thoses kinds of features, users only have to click on "download Vulkan Ctrl" to have all importantes features of vulkan installed and to be ready to work with it as quickly and simply as possible.

What you think about this idea ?

Best regards

I would like to have that and was already thinking about it. Unfortunately I do not think there is a simple/clean way how to do that...

But I am definitely open to discussion.

Now thinking about it, maybe it would be actually possible to ship the whole SDK as part of package somehow? Like introducing "bin" subfolder of package or something like that. Of course, that would only help for Win32.

Not sure how to handle that in Linux. Maybe a set of installation scripts for various distros? I guess users would be disappointed about having win32 oriented SDK installed with upphub....

Mirek

If we take the Vulkan SDK as an example, the installation executable will set up some path variable. this assertion could be true for some other package, so installing it as part of the Ctrl like a bin directory is not, IMO, a good idea. It mean that all users which already have the SDK installed in a proper way will have 2 differents SDK located at 2 differents places.

Quote:I do not think there is a simple/clean way how to do that  
Indeed, maybe the simplest way to do it is by simply, in case of Vulkan Ctrl, reference somewhere in the package that this one need to have a SDK (or lib) installed to work and, in downloading (or even starting compilation of code) TheIDE could just ask to the user if the install executable should be downloaded ( "The LunarG Vulkan SDK is necessary to run this package, would you like to download the SDK ?" ) and as soon the user say "yes" then TheIDE download the executable (in case of windows) from official website and execute him. Reste of scenario is left to the user which will be able to configure all insallation setup.

To speak more about a UppHub package that requires external dependencies like a possible Vulkan one. It's, most of the time (not always), possible that the build method needs to be modified to include those external dependencies. IMO, having a single package modifying the actual build method is a bad way of working. However, maybe it could be possible to add a way to import the build method from a UppHUB repository. At the time you download a package like VulkanCtrl, TheIDE asks you if you want to import the custom build method that comes with this package. What do you think about this idea Mirek ?
