Hi all,

I'm new here. Just a question: is there a way to mapping a button (maked by layout designer) with the code? Can anyone describe me the necessary steps?

Thanks in advance,

Pasquale.

Pasquale,

You might take a look at the "Button" example.

The difference with what you are looking for is that the button is added via the layout designer.

It is about the same:

- Do not declare the button as a class member,
- But use the button with the name defined in the layout designer.

Hope this help,

Victor

Victor

Do not forget to enter that name into layout...

Tanks so much, victor.

Pasquale.
