Could you please add attached .gitignore to the git repo?

TIA

Mirek
For example, I often intentionally/accidentally alter Upp source code.
At some point I need to check a status of Upp source code.
I also need to check presence of my own configuration files inside of the Upp repo.
.cache folder is often created inside of the git repo. This is pretty much the case with all my test builds.
Well, I can live without this .gitignore file, but in this case my status view will always be spammed.

This is how it looks when it is clean:

And this is how it looks when it is bloated:

.cache folder is often created inside of the git repo. This is pretty much the case with all my test builds.

Well, that is the essence why I am asking. Why is .cache there?

I mean, we worked hard to isolate build files from the source tree, that is why gitignore feels like weird request...

Automatically created configurations. Each lives in its own folder. I can have dozens of them on one machine.
One per a compilers, for example.

Whatever. I'll survive without that.

I can actually do it, no problem, but I guess it would be better to do that when git becomes primary repo (so far, it is still just downstream from svn).

Thanks. There is really no need for that. I can do that in my internal version of Upp, which is protected from a github version by a build system.
They were identical. Now they will be slightly different.
Sorry for making a trouble.
