Hi all,
how I can remove the last empty paragraph, if there is, from a QTF source, prior to merge it with a second QTF text? For exemple:

```
RichText rta, rtb;
ParseQTF(rta, a);
ParseQTF(rtb, b);
rta.CatPick(pick(rtb));
return AsQTF(rta, CHARSET_UTF8, options);
```

How can check if in rta the last paragraph is empty and remove it?

You will have to use RichText methods which are unfortunately undocumented ATM.

Anyway, the idea is that RichTxt is an array of "parts". Part can either be a paragraph or a table. If it is table, then each of cells is another RichTxt recursively. Difference between RichText and RichTxt is that RichText contains paragraph styles too, so that way they can be shared between top-level paragraphs and paragraphs in the table (RichText is derived from RichTxt).

Now for your needs, you will need

RichTxt::GetPartCount to get the index of the last paragraph (-1)
RichTxt::IsPara to check that it is a paragraph
RichTxt::GetPartLength to check that is empty
RichTxt::RemovePart to remove it
