hello, id love to read about all those usefull things you can do with that plugin.

My planned task is as follows:

id like to read in a .db file created by another sqlite db (what im coding is a external module for that project.).

I tried to get bihind the usage by looking at the example over and over, tweaking here and there but without sucess(my bad).

So before i rush into try n error or try to get behind it reading the code behind the plugin (which i am going to do now) im asking here for a solution covering all to enough odds that might hit me. Thanks in advance.

edit: try n error luck

now i have to dig into the syntax for reading stuff from it again the only help is assist++ first question is regarding sql.fetch(Fields)

how do i throw a field in there? sqlid style? would result in ambigius overloaded function call because of string is not within scope hm?

Currently im trying to read data from the database using:

```
Sqlite3Session sqlsession;  
sqlsession.LogErrors(true);  
if(!sqlsession.Open(fn)) {  
    PromptOK("Can't create or open database file\n");  
    return;  
}
```

```
Sql sql(sqlsession);  
sql*Select("max(roundid)").From(Unit);
```

```
while(sql.Fetch())  
    PromptOK(Format("%s",sql[0]));
```

compiles without errors but leads to a failed assertion:

Sqlite3upp.cpp in Line 236

NULL != current_stmt

wrong usage?

I am not sure whether it is the problem, but should be

```
SqlId ROUNDID("ROUNDID");
```

```
sql * Select(SqlMax(ROUNDID)).From(Unit);
```

Alternatively (and perhaps the right thing for start)

```
sql.Execute("select max(roundid) from Unit");
```

[View Forum Message](#) <> [Reply to Message](#)

the assertion is at the beginning of Sqlite3Connection::Fetch()
current_stmt is the currently executed query. Im still lost 8/

When i comment that Assertion out, table_list.GetCount() returns 0 as expected when theres no current_stmt (its 0 or NULL). current_stmt_string is set like it should though ("select tbl_name from sqlite_master where Type='table'").

If thats a bug in the plugin it would have occurred to more people i guess so could somebody explain to me what i am doing wrong there?

I managed to get the SQLite3 reference example running but the only thing thats different is in the simple.h

```
#define SCHEMADIALECT <plugin/Sqlite3/Sqlite3Schema.h>
```

```
#define MODEL <SQL_Sqlite3/simple.sch>
```

```
#include "Sql/sch_header.h"
```

and in simple.cpp

```
#include <Sql/sch_source.h>
```

those are afaik only used to create the .db file so even using those isnt helping me 8/ can somebody tell me when current_stmt is NULL within a fetch() ? there must be a pretty simple reason...

i have attached the .db file im working with, apparently it has no tables when i use it with the sqlite example. Might be related to the MODEL define which isnt matching our build, which leads me to my next question:

do i need to define a MODEL when im just reading a db file?

Well, looks like sqlite plugin authors are not around now...

Anyway, of course, MODEL is not required.

If you can, please .zip your source package and post it here as well. I will try to investigate what is going wrong..

BTW: It would be nice to update sqlite to the newest version as well as sdl library. I'll take care about sdl but what about sqlite?

Please remove "sqlite.lib" in package organizer. Sqlite is "totally embeded" in U++ (there are

complete sqlite sources in plugin/sqlite) ... and even if it was not, standard is to interface with library in interace package, e.g. MySql library is added by MySql package - no need to add them into main project.

Without that lib your code seems to start...

uhm yes it starts, but even without it it wont fetch anything from the database.
I tried to use an SQLWrapper instead of the plugin thats why the lib was still there (forgot to remove it) when i remade the plugin using implmentation to post here.

Right now I have no sqlite database file around to test... Is yours short enough to post?

It seems that sqllite returns "unsuported file format" error....

BTW, it pays off to add "session.SetTrace()" for debug mode...

uhm its a default sqlite3 .db file afaik
created on a ubuntu system i guess.
Might be an amd64 ... could that interfere?

I have tried to wake up the author of plugin...

It is also possible that it is some newer format version - plugin is last updated year ago.

Meanwhile, in other thread, sqlite seems to work fine...

The database I am using was actually created by U++'s SQLite package. While I was testing it out,
at one point I was using a SQLite db created elsewhere. I could not get it to work (may be due to
version incompatibility, may be something else) so I moved on to something different. I eventually
ended up using the example program to create my tables in a new database.

OK, I think the one possible cause is old Sqlite in plugin. We will try to update to latest version
soon, most likely tomorrow.

It may be a versioning problem, but you should also be aware that there are two main versions of sqlite. Sqlite2 and Sqlite3, and the API and databases are not compatible between them. The UPP plugin code is Sqlite3, but an old version. If you want the newest version, see my recent post on updating the sqlite3 plugin.

EDIT: I downloaded your file and tested it out. The old sqlite plugin version was 3.2.7, I believe, which did not read your db file. The new version is 3.3.6 and does read your db file. So upgrade to the newer version and you should be fine.
