using an old project I wanted to recompile which uses Controls4U from bazaar:  
I modified it to use UppHub, fresh Upp install, no bazaar folder and no my\_app flying around, all files under "c:\dev\upp".

Trying to compile Controls4U\_Demo i get the same compile errors like with my old projects  
I'm on Windows 10 tried out with MSVS19 and CLANG (in 32 and 64 variants)  
Even with new bin files from nightly (i.e. updated Clang) I get the following errors:

My other projects (without Controls4u) just compile nicely...

is Controls4u out-of support ? not managed or tested ?

What shall I do, where do I get corrected files ?  
rgds Ralph

okey, I now pulled the newest sources from Controls4u from Anboto  
<https://github.com/anboto/Anboto/tree/master/Controls4U>  
and tug them under my project they compile nicely with clang/MSVS19...

Hello,

I will repeat it one more time Anboto fork is waste of time. It is causing too many problems and it is expensive to everyone. UppHub package contains patches that Anboto doesn't have. For example compatibility with recent wchar changes. On the other hand UppHub version doesn't have recent changes from koldo. Thanks to that we have vicious circle.

Koldo, if you are reading this word please consider backing to develop Anboto components under Libraries for you organization. I know that managing multiple repos, might be difficult, but you

should used to it. U++ The good of U++ framework requires it. Divided we will never achieve success.

Klugier

Except it does not. Be more careful reading posts.

(Now working on the fix...)

I apologize for problems, should be fixed now (in UppHub) and should be working with current U++ version.

Hi there ...

Seems to be still a problem.

I've checked also in SVN, whether the files in upp\bazaar\Controls4U are actual: these are.

Best Regards  
dschoni

Hi there ...

<https://github.com/anboto/Anboto/tree/master/Controls4U>  
Thanks for the Link to GitHub, Typhoor.

The upp repository contains in ActiveX\_base.h at line 28  
WString ret(static\_cast<wchar \*>(bstr));  
which is not accepted by the compiler.

But the Github code contains  
WString ret((wchar \*)bstr);  
which works.

So that seems to be actual.

I've corrected the upp code by using the ones from GitHub. The I've got the next problems: The same with Functions4U, which is included in the demo and is also compiling with errors.

From here on I'm lost, because the difference in the code is too much for me to handle. (I'm just a beginner ...)

Why is it so hard to make the examples working?  
Shouldn't these simply run out of the box?

Best regards  
dschoni

Please use the UppHub sources hosted in <https://github.com/anboto>. They are maintained and improved. Bugs are solved overnight.  
The author of Controls4U does not guarantee the functionality of other sources.

Hi there ...

In the end I made it.  
I had to replace any WString trough Vector<WCHAR>.

As example:

```
Vector<WCHAR> wfileName = ToSystemCharsetW(String(fileName));  
wfileName.Add(0);  
FILE *fp = _w fopen(wfileName, L"rb");  
//FILE *fp = _w fopen(fileName.ToWString(), L"rb");
```

(Functions4U.cpp and more ...)

Wow, this was hard work! But now it works perfectly.

Best Regards  
dschoni

Great!

Thank you, this is working out of the box.  
Seems to have some improvements too.

Best Regards  
dschoni
