Hi guys! I'm using U++ to develop a desktop application and I find it quite useful, I already knew the platform since I used it back in 2006-7 to create a system for tracking machine reparations in a job I had back in that years.

What im trying to do is to create some Unit testing for my application models. I read that UnitTest++ can be used from Bazaar, but this is the best choice? I also didnt find any bazaar in 7Z files of latest builds. It's deprecated?

What do you recommend me to craft a test suite in U++? Maybe there a better alternatives in UppHUB, for example.

Thank you@!

Hello,

You could use mine test package - GoogleTest, that could be directly downloaded from UppHub. The package serves as a Upp wrapper to Google Test and Mock library.
