What is this good for (it is inline method):

```
template <class T>
void lze(T& io) {
    for(Ctrl& q : *this)
        if(dynamic_cast<EditField *>(&q)) {
            Value v = ~q;
            io(q.GetLayoutId(), v);
            q <<= v;
        }
}
```

serialization of content of edit fields, so any form can be saved/restored mid way while being edited, or having auto-save for some restore, etc.
