In order to chameleonize it, I have rewritten TabCtrl from the scratch... (means expect all kinds of troubles..)

Mirek

First trouble is the view frame is too big at the bottom. Second is the body of tabctrl is filled with a color during resizing and it cause ugly flickering when others controls are placed on it. Besides: new tab looks very good!

The test view frame bug just do:

```
ArrayCtrl arr;  
tab.Add("Tab1", arr.SizePos());
```

"view frame bug" is fixed, however, I do not see flickering... Any testcase?

Is now backpaint set to on by default? I had flickering because in constructor of my app was BackPaint(false).

Anyway, before new tabctrl even with backpaint set to off there was no flickering when resizing the application.

No. There is however difference between old and new TabCtrl - old one was single Ctrl with "areas" defined, while new one is composition of 3 Ctrls.

Anyway, I still do not see any flickering... And no, BackPaint is not "on" by default (although I would like to do that, you know

However, still have not noticed any flickering.

Backpaint is not on, but TRANSPARENTBACKPAINT is (and ever was).

TabCtrl is now Transparent.

Seems like the time has come to improve painting model....
