Hi Guys,

I have a project to manage documents. The app has its own scanner manager (ole/Wia), which could also create pdf files based on bmp/jpg conversion. I am also able to implement a textual report renderer to write pdfs.

Unfortunately, I have other pdf files which were not generated by my app. So, I would like to parse it for some reasons.

In my understanding the PdfDraw can only render pdf format (see PdfDraw::Finish() function), but it is not able to read/load/parse a pdf file. Am I right ?

Is it a project on-going development somewhere to have this feature for U++ ?

My actual goal would be,

load an external pdf file, parse it some level to check the signature(s), add a signature to an ordinary pdf file. render one static view (in example ctrl::paint(draw&) way would be fine)

in case of image is encoded into the pdf, that is not a problem for my use-case. in case of vector graph/text content is in pdf, some kind of graphical render is needed.

to be able to display pdf files on linux, windows and maybe with Turtle later.

To be able to read & render a pdf file from within U++ program is definitely something desirable.

This C project/repo might be a good starting point. It's in Apache 2.0 license which is quite permissive. Adapting it to U++ and adding drawing capability should not be too difficult.

Hello,

I wonder if there have been news about a pdf viewer in the meantime.

Thanks,
Luigi
